outer planets are called the gas giants. The huge size of each outer planet creates strong gravitational forces. These gravitational forces put so much pressure on the atmosphere of each planet that the gases change to liquids. As a result, the outer planets are mostly liquid inside.

The Outer Planets 3 •

Ganymede is larger than the planet Mercury and is the largest moon in the solar system. • Io is under a constant tug-of-war between the gravities of Jupiter and Europa. • This heats up the interior of Io and causes it to be the most volcanically active body in the solar system.

The planets' orbits may also become unstable. As the red giant loses mass, the star's gravitational hold on its planets becomes much weaker, so their orbits will expand. In our own solar system, the Sun will throw off about half its mass, so the outer planets' orbits will drift outward, settling twice as far as they are today.
