20-node orthotropic solid elements with 3 degrees of freedom (DOF) per node, and the latter, developed by the University of Genoa, adopts shell elements with 6 DOF per node. The results obtained from the two finite element modeling methods are compared with experimental results from testing flat composite panels with and without delaminations.

Comparison of different finite element methods. A wide variety of finite element methods (FEM) exist to stably approximate partial differential equations with higher-order accuracy. A key issue is how to achieve this stability for problems in which convection is a significant effect.

Making finite elements behave as finite differences. With a simple trick, using numerical integration, we can easily produce the result  $(u_i=f_i)$  with the Galerkin or least square formulation with P1 elements. This is useful in many occasions when we deal with more difficult differential equations and want the finite element method to have properties like the finite difference method ...

Abstract: The comparison of two methods for the numerical solution of two-dimensional nonlinear eddy-current problems using the finite element method is presented in this paper. An exact solution is obtained by time-step calculation; all influences except iron hysteresis are taken into account. The second method is limited to the solution of quasi-stationary problems; the solution is based on ...

A structure-preserving implicit Euler finite-element scheme for a degenerate cross-diffusion system for ion transport is analyzed. The scheme preserves the nonnegativity and upper bounds of the ion concentrations, the total relative mass, and it dissipates the entropy (or free energy). The existence of discrete solutions to the scheme and their convergence towards a solution to the continuous ...
