Concept-Development 34-1 Practice Page Electric Current 1. Water doesn't flow in the pipe when (a) both ends are at the same level. Another way of saying this is that water will not flow in the pipe when both ends have the same potential energy (PE). Similarly, charge will not flow in a conductor if both ends of the conductor are at the same electric potential.

**34 Electric Current - Heck's Physics**  
The current of 10 amps approaching point B is divided into a 6-amp pathway (through resistor 2) and a 4-amp pathway (through resistor 3). Thus, it is seen that the current values in the three branches are 2 amps, 6 amps and 4 amps and that the sum of the current values in the individual branches is equal to the current outside the branches.

**Electricity | Conceptual Physics**  
Electric current is the sustained movement of charges in a conductor. 1 Ampere = 1 Coulomb/second. In other words, a current of 1 Ampere exists at a point in a circuit if 1 Coulomb of charge pass that point each second. Voltage is the same as electric potential.
