Seventh grade Lesson in Exponents 1- Negative Exponents

A negative exponent means how many times to divide by the number. Example: $8^{-1} = 1 \div 8 = 1/8 = 0.125$. Or many divides: Example: $5^{-3} = 1 \div 5 \div 5 \div 5 = 0.008$. But that can be done an easier way: 5^{-3} could also be calculated like: $1 \div (5 \times 5 \times 5) = 1/125 = 0.008$.

Negative Exponents and Zero Exponents. So far in this unit, you've learned how to simplify monomial expressions with positive exponents. Now we are going to study two more aspects of monomials: those that have negative exponents and those that have zero as an exponent.. I am going to let you investigate to see if you can come up with the rule on your own!

The exponent tells you how many times to multiply the base by itself. 4^3 is NOT 4×3 . It is $4 \times 4 \times 4 = 64$. If a base is negative, it must be in parentheses to use it when you multiply. Otherwise, your answer will always be negative. $(-3)^4$ means $-3 \times -3 \times -3 \times -3 = 81$. -3^4 means negative or the opposite of $(3 \times 3 \times 3 \times 3) = -81$.
