engine in 1876. Two years later he built a successful IC engine. Otto was the first to use the four-stroke cycle, i.e., the intake, compression, power, and exhaust strokes that are still used in most IC engines today. With the expiration of the Otto patent in 1890, there was a spurt in development and commercialization of IC engines.

An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

Fuel-Air Cycle The theoretical cycle based on the actual properties of the cylinder contents is called the fuel - air cycle. The fuel - air cycle takes into consideration the following: 1. The actual composition of the cylinder contents. 2. The variation in the specific heat of the gases in the cylinder.
