Locomotion And Posture In Older

Aging causes many motor, sensorial and neural deficits, which impair locomotion and postural control in the elderly. The severity of this framework is worsened when the aging goes along with a movement disorder, such as Parkinson disease, Chorea, Dystonia, Huntington disease, etc.

of each type of locomotor movement. The development of locomotion was viewed as an outward illustration of endogenous changes in the brain and body. In their view, locomotor behavior 'grows' as an accompaniment to infants' maturing brains and bodies. Because motor behaviors are more accessible to observation than neuromus-

Motor and Physical Development: Locomotion

Even healthy older adults walk 20% slower than younger adults - this is primarily due to a decrease in stride length as opposed to stride frequency. This decreases arm swing, increases double support time and results in a more flat-footed walk.

Physical Activity in Older Adults Posture • Any significant age associated decline in pelvic and spinal flexibility in particular, can result in flexed or stopped posture. • Flexed head and kyphotic posture among older adults greatly restrict movement and place them at greatest risk for backward falls.

Studies on ageing in posture control have documented the increasing difficulty encountered by older people in maintaining their static equilibrium and in restoring their balance when it is disrupted either by external events or by the subject's own activity.

Posture - an overview | ScienceDirect Topics

Disorders of posture, balance, and gait are debilitating motor manifestations of advancing Parkinson's disease requiring rehabilitation intervention. These problems often reflect difficulties with coupling or sequencing posture and locomotion during complex whole body movements linked with falls.
