A novel approach to develop on-chip transformer baluns in the stacked configuration is based on a design which includes a stack of two consecutive identical spirals connected in series to function as a single-ended coil, and two distinct spirals acting as differential coils correspondingly (Figure 8) . The primary and secondary coils are separated by an

proposed on chip transformer uses IBM 0.18 μm CMOS process which support two thickest upper metal layers in the seven metals as in table 1. The thicknesses of the aluminium and copper layers of upper two metals are 4 μm and 3 μm , respectively. They show over 10 times smaller sheet resistances than other layers.
