In geometry, the tangent line to a plane curve at a given point is the straight line that "just touches" the curve at that point. Leibniz defined it as the line through a pair of infinitely close points on the curve. More precisely, a straight line is said to be a tangent of a curve $y = f$ at a point $x = c$ if the line passes through the point on the curve and has slope f' , where f' is the derivative of f . A similar definition applies to space curves and curves in n -dimensional Euclidean space. As
