However, other small molecules lacking these particular molecular properties, antisense drugs, and peptide-based pharmaceuticals generally undergo negligible transport through the blood-brain barrier in pharmacologically significant amounts. Therefore, if present day CNS drug discovery programs are to avoid termination caused by negligible blood-brain barrier transport, it is important to merge CNS drug discovery and CNS drug delivery as early as possible in the overall CNS drug development ...

First, it is clear that nearly all drugs with CNS effects act on specific receptors that modulate synaptic transmission. While a few agents such as general anesthetics and alcohol may have nonspecific actions on membranes (although these exceptions are not fully accepted), even these non-receptor-mediated actions result in demonstrable alterations in synaptic transmission.

► Strategic drug delivery to the brain (SDDB) is a rational drug development approach that considers interactions among the BBB, CNS target, candidate drug, and disease. ► A leptin antagonist that blocks blood-borne leptin from crossing the BBB increases body weight. ► A leptin agonist that crosses the BBB independently of the leptin transporter decreases body weight.

The essential principles of DPLC are composed of management responsibilities, quality assurance, and drug design monitoring units (Figure 5). The ICH quality system approach requires sponsors of NDAs to establish and maintain procedures to control the design of the drug product in order to ensure that specified requirements are met.
