Epileptic spasms, is an uncommon-to-rare epileptic disorder in infants, children and adults. It is named after the English physician, William James West (1793-1848), who first described it in an article published in The Lancet in 1841. The original case actually described his own son, James Edwin West (1840-1860). Other names for it are "generalized flexion epilepsy", "infantile

Epilepsy is one of the most frequent neurological diseases. In focal medically refractory epilepsies, successful surgical treatment largely depends on the identification of epileptogenic zone. High-frequency oscillations (HFOs) between 80 and 500Hz, which can be recorded with EEG, may be novel markers of the epileptogenic zone.
