### Series And Parallel Circuits Lab

The objective of this lab is to study circuits with re-sistors connected in series, parallel, and combination. Theory In the previous experiment, you constructed 4 circuits, each circuit built with one resistive element. In this experiment, you will construct circuits using multiple resistors. The first type of circuit you will construct is a series circuit (Fig. 16.1 and Fig. 16.4). In a series circuit,

### Experiment 16: Series and Parallel Circuits

Background: A series circuit is one in which electricity flows along a single conductor through two or more loads. In a parallel circuit, the electricity has more than one path through the circuit. A typical two-cell flashlight has the cells connected in series.

### Lab: Series & Parallel Circuits

In this experiment, you will Measure potential difference and current at various places in series and parallel circuits. Track the energy/unit charge and the current as charge flows through batteries and resistors in series and parallel circuits. Determine the relationship between potential difference and resistance in series circuits.

### Series and Parallel Circuits - Vernier

Introduction The goal of this experiment is to understand series and parallel circuits, calculate their equivalent resistance, and construct them in the laboratory. There will be four circuits which the resistance will be theoretically and experimentally calculated. The voltage and

The calculated equivalent resistances for the series circuits will abide by the equation  $R_{eq} = R_1 + R_2$  and for the parallel circuits the value will be similar to  $1/R_{eq} = 1/R_1 + 1/R_2$ . The current flow is expected to be uniform throughout the series circuits, but will be stronger through the smaller resistor in the parallel circuits.

Series circuit the total equivalent resistance  $R_{eq}$  in a circuit is given by:  $R_{eq} = R_1 + R_2$  The next type of circuit you will make is a parallel circuit. Resistances are said to be connected in parallel when the potential difference applied across the combination is the same as the resulting potential difference 1 Figure 19-1\_Series Circuit Schematic Figure 19-2

### Experiment 19 Series and Parallel Resistances

Notice that in some nodes (like between R 1 and R 2) the current is the same going in as at is coming out.At other nodes (specifically the three-way junction between R 2, R 3, and R 4) the main (blue) current splits into two different ones. That's the key difference between series and parallel!. Series Circuits Defined. Two components are in series if they share a common node and if the same ...

parallel connection. In a series circuit, there is only one path for the current to flow therefore all parts of a series circuit have the same current. In a parallel circuit, each device has a connection to the power supply, independent of the other device. The current divides, with some passing through each parallel

Experiment 4 – Resistors in Series & Parallel Objective: In this experiment you will set up three circuits: one with resistors in series, one with resistors in parallel, and one with some of each. You will be building circuits similar to the ones you will be working with in homework and exam problems. This experiment should show you the difference

### Experiment 4 – Resistors in Series & Parallel

Another difference in a series circuit vs a parallel circuit is that in a parallel circuit, the voltage across all legs of the circuit is the same. It's the current that divides up and flows though the various elements in proportion to their value. The amount of current through each element depends on the resistance of the element.

In this lab, we will consider two ways of connecting circuit elements: series and parallel . For both series and parallel circuits, one can change the order of sub-circuit components (e.g., a lightbulb or a resistor) without changing what the circuit does. Consider the circuit shown in Figure 1b.
