The Drawworks And The Compound

The drawworks is a part of the system that rotary drilling rigs use for hoisting, or lifting, the drill stem and casing out of the hole. A compounding transmission, or compound, sends power from the engines to the drawworks, the rotary table, and the mud pumps. This training manual gives an overview of both these pieces of machinery and how they are used together to do the hoisting work of the rotary rig.

Compound Rig - Roughneck City

A drawworks is the primary hoisting machinery component of a rotary drilling rig. Its main function is to provide a means of raising and lowering the traveling block . The wire-rope drill line winds on the drawworks drum and over the crown block to the traveling block, allowing the drill string to be moved up and down as the drum turns.

In addition to the compact design of the compound further novelty resides in the layout and design of drawworks drive system and of the main drum assembly. In the drawworks drive system a unique split-transmission arrangement to receive the accumulated prime mover force and transmit it to the drawworks utilizes two compact transportable transmissions as opposed to the old single unit two-speed transmission system.
