passages within the block and head. These passages let the coolant circulate around the "hot spots" (valve seats and guides, cylinder walls, combustion chamber, etc.) in order to cool them off. The engine block is actually manufactured in one piece with the water jackets cast into the block and cylinder head.

### **coolant flow radiator and engine block**

The cylinder heads are aluminum, and all EcoBoost engines but the 1.0L and the 2.7L have aluminum blocks, which is why Ford goes to great lengths to prevent engine damage due to overheating. The compression ratio is a modest 10:1 for all GTDI engines except the 2.0L, which is 9.3:1, and the 2.3L, which is 9.5:1.

coolant channels running through them. At the top of the cylinder head all the channels converge to a single outlet. A pump, driven by a pulley and belt from the crankshaft, drives hot coolant out of the engine to the radiator, which is a form of heat exchanger. Unwanted heat is passed from the radiator into the air stream, and ...

They mentioned that even as little as a 3-4 degree temperature difference (using the old Windsor design FRPP block and Yates heads) played havoc with hp creation, cylinder to cylinder timing, etc. The new engine was designed with water jackets and overall coolant flow to have zero difference between all eight cylinders.
